Statistics and forecast Q1 2020

This is SWEA:s quarterly statistics and forecast for the Swedish wind power market, covering data from turbine manufacturers and wind power developers acting on the market.

SWEA, Swedish Wind Energy Association - Svensk Vindenergi

2020-05-04
The statistics and forecast

- **The statistics** are based on the order books of the turbine manufacturers and project portfolios of the wind power developers presented at an aggregated level.

- **The forecast** are based on current and future market conditions.

- **Base case**: Projects with turbine contracts (firm and binding), approximately 30 percent of permitted projects and 15 percent of projects under permission process will be realized. This is the most realistic scenario and is the official forecast.

- **Low case**: Only projects where turbine contracts (firm and binding) have been signed will be realized. In this scenario no further investment decisions are made. Thus, this scenario defines the lower limit of wind power growth in Sweden.

- **High case**: Projects with turbine contracts (firm and binding), around 60 percent of permitted projects and 30 percent of projects under permission process will be realized. This scenario is more optimistic and sets the ceiling for growth of wind power in Sweden.
Previous year

Total by the end of 2018

- Turbines: 3 652
- Capacity: 7 395 MW
- Actual production: 16,4 TWh*
- Annual production (estimated): 19,5 TWh**

Added capacity in 2019

- 1st quarter: 136,2 MW
- 2nd quarter: 140,8 MW
- 3rd quarter: 519,0 MW
- 4th quarter: 792,4 MW
  Total: 1588,4 MW

Total by the end of 2019

- Turbines: 4 099
- Capacity: 8 984 MW
- Actual production: 19,5 TWh*
- Annual production (estimated): 24,7 TWh**

* Actual production is the real production and depends on wind conditions and when installations are made during the year.

** Estimated annual production is the annual production the turbines are expected to produce when in operation during a whole year with normal wind conditions.
Installations in 2020

Total by the end of 2019
Turbines: 4 099
Capacity: 8 986 MW
Actual production: 19,5 TWh*
Annual production (estimated): 24,7 TWh**

Added capacity in 2020
1st quarter: 207,8 MW (actual)
2nd quarter: 187,0 MW (forecast)
3rd quarter: 604,7 MW (forecast)
4th quarter: 830,6 MW (forecast)
Total: 1830,1 MW

Total by the end of 2020 - forecast
Turbines: 4 540
Capacity: 10 816 MW
Actual production: 26,6 TWh*
Annual production (estimated): 30,9 TWh**

* Actual production is the real production and depends on wind conditions and when installations are made during the year.

** Estimated annual production is the annual production the turbines are expected to produce when in operation during a whole year with normal wind conditions.
New turbine contracts* (firm and binding)

* Figures from all turbine manufacturers acting on the Swedish market

Permitting – a serious obstacle

- The overall picture is that too few new projects are started, as it is very difficult to find new wind power projects in good locations where it is considered likely that a permit will be granted.

- Drawn-out and uncertain permit processes are currently the greatest obstacle to the development of wind power.

- To reach the target of 100 percent renewable electricity generation and at least 90 TWh of wind power by 2040, many new permits for wind farms are needed.

- The time from initial consultation to environmental permit can exceed 10 years. Meanwhile, technological progress is fast, and the terms of the permit seldom leave scope to use the best possible technology, as the Environmental Code instructs that it should.

- The process must adapt to rapid technological developments so that wind resources can be utilized as efficiently as possible.
Fewer new permits and applications

- In 2019, only six wind power projects (135 turbines) received final approval.
- In 2019, only 11 new applications (140 turbines) were submitted.
- The number of new projects, where consultations has been started, has been halved during the period 2014-2018.
- Decided cases have decreased from close to 50 parks in 2014-2015 to 25-35 parks in 2017-2018.

Permitting – a serious obstacle

• Drawn-out and uncertain permit processes are currently the greatest obstacle to the development of wind power.

• To reach the target of 100 percent renewable electricity generation and at least 90 TWh of wind power by 2040, many new permits for wind farms are needed.

• The time from initial consultation to environmental permit can exceed 10 years. Technological progress is fast, and the terms of the permit seldom leave scope to use the best possible technology, as the Environmental Code instructs.

SWEA:s suggestions to improve and speed-up the process:

✓ The municipal veto against wind power should be adjusted so that the municipality’s decision comes early, concerns the location and is not allowed to be changed during the process.

✓ The municipalities, instead of the state, should be awarded the property tax on wind power.

✓ The Environmental Code should be adjusted so that climate benefits are more strongly prioritized when weighed against other interests.
Scenario 2040

The following slides are based on SWEA’s roadmap 2040.

In recent years, most new wind power projects have been built in the north of Sweden. But, the expansion in the north might slow down. After 2023, it is possible that bottlenecks in the grid and price differences makes it more attractive to invest in small projects in the south.

In the medium term, repowering is starting to take place in the south, where also many of the new turbine orders are placed. Together with offshore wind power, which will have a central role in the Swedish electricity system in 2030-2040, the expansion can even out between north and south until 2040.

Even so, Swedish TSO (Svenska kraftnät) still need to strengthen the grid’s transmission capacity from north to south. This will be even more critical if Finland does not remain a net importer of electricity.

Interestingly, due to technological development and repowering, the amount of wind turbines in Sweden will peak around 2027 (approx. 5 800 turbines) and then gradually decrease to below 4 000 turbines in 2040.
